## Cankerworms Active In Oak Trees

[By Leroy J. Hajdik County Extension Agent]

Cankerworms are being found in some oak trees of this area. Last year the county experienced a severe infestation of the leaf-eating worms which in many instances totally defoliated the infested trees.

Cankerworms belong to the family Geometridae. Other common names include inch worm and measuring worm. These names allude to the spanning or measuring action of the worm as they move from place to place. Cankerworms have the habit of moving from branch to branch or dropping from trees on silken threads.

The worms are about one inch when full grown and are relatively slender. They feed on buds and unfolding leaves. Color varies since there are both green and dark larvae of this species.

Control may be obtained by spraying the worms with Malathion, Sevin, Orthene, and Methoxchlor. A biological insecticide sold under the trade name of Dipel or Bactur will also effectively control the insect. This material is safe to use as it is non-toxic to humans, pets, or wildlife. If a bacteriological is used, it is recommended to treat late in the afternoon when temperatures are cool. Also it is advantageous to add a small amount of liquid detergent or a commercial surfactant as a spreader-sticker which allows for more effective spray coverage. The biological will provide slower worm death (three days) but the worms cease to feed once they feed on the sprayed material.
